

What the more aggressive assumption changes

The current mirrored-reference master is at left. The candidate at right treats unassociated mottling as background noise.

Current conservative master

Aggressive cleanup candidate

Open areas become much cleaner and the control-rod drawing is easier to separate visually from its background. Original text and sustained linework are protected. The kept pixels retain their existing grayscale values; nothing is retyped, sharpened or geometrically redrawn.

Upper left - pale ghost and scattered marks

Identical enlarged crops. Blank regions are explicitly cleared while the body edge, rods, leaders and lettering retain source pixels.

Current

Aggressive

The background no longer competes with the fine drawing. This is a stronger editorial assumption than the preceding reverse-page model: isolated weak marks outside recognizable structures can disappear.

Lower left - the conspicuous mottling

The larger mottled clusters between clear lines have been removed. Some remnants stay where they touch the circular outline, leaders or lettering.

Current

Aggressive

The first tight mask clipped part of the circular outline. The removal map exposed it, and the reviewed candidate protects that original curve. It does not replace the curve with an ideal circle.

Lettering and thin-line checks

The current and candidate use the same grayscale source values in protected areas. Frame positions and the 1251 x 1054 pixel canvas are unchanged.

Current

Aggressive

Small standalone labels need explicit protection: the bottom dimension 14 and the STUD callout were retained after checking what the draft removed. Protected text, fractions and dense mechanical details are pixel-identical to the current master.

Exactly what was removed

Red shows deleted source marks. This provides an auditable comparison, including any questionable isolated marks that the assumption classifies as noise.

Candidate scope

Separate comparison copy.

Current book master retained.

No geometric resampling.

No replacement lettering or lines.

Kept pixels are unchanged.

Deleted pixels become white.

Remaining uncertainty: isolated dots, weak ticks and marks that do not form recognizable text or a clear line may be lost. Some noise adjacent to retained strokes remains.

Review suggestion

Use the whole plate to judge readability, then the enlarged crops and red map to decide whether this editorial tradeoff is acceptable.
